Bulletin 81-1 October 1981

"Printed by authority of the State of Illinois"
October 1981, 5,050, 1808

FOREWORD

This annual summary of Illinois Agricultural Statistics presents a summary of the various reports prepared and published by the Illinois Cooperative Crop Reporting Service plus selected other data series of general interest.Data for the years 1975-80 and 1981, when available, are presented for most items.

Official State estimates are included in this summary for all data items. In addition, crop reporting district and county estimates are included for major crop and livestock items.

Some of the estimates presented in this publication were prepared from State financed surveys. Funds and personnel in the Illinois and United States Departments of Agriculture are pooled in the Cooperative Crop Reporting Service in order to better serve the needs of those interested in agricultural statistics.

The Crop Reporting Service wishes to express its appreciation to the many thousands of farmers and business firms who contribute every year to provide the basis of our estimates. Only the faithful service of the corps of reporters and other cooperators makes these estimates possible.

James R. Kendall

GENERAL ILLINOIS INFORMATION

This first section of the Annual Summary presents a long time history of changes in Illinois' total population, farm population, number of farms and land in farms. In addition, general information about the climate of Illinois is included. The map and explanation below of Crop Reporting Districts is also presented to aid in understanding the detailed data in this report.

CROP REPORTING DISTRICTS

For statistical purposes the counties of Illinois are grouped into nine Crop Reporting Districts (shown on the map at right). These groupings represent divisions of approximately equal size with similar soils, growing conditions and types of farming.

Crop Reporting Districts are used in the compilation of most reports. It is not possible to collect sufficient data for each county to make county estimates on a timely basis. It is possible to summarize data at a district level and weight districts together by production percentages to arrive at the best State estimates.

Many data series in this bulletin present estimates for Crop Reporting Districts. Some series are further broken down into county estimates within districts.

CLIMATE OF ILLINOIS

Illinois lies midway between the Continental Divide and the Atlantic Ocean and some 500 miles north of the Gulf of Mexico. The climate is typically continental with cold winters, warm summers, and frequent short period fluctuations of temperature, humidity, cloudiness and wind direction. The excellent soil and well distributed annual precipitation of 32 to 48 inches favor a very high standard of agricultural production.

Storm systems move through the State most frequently during the winter and spring months, and cause a maximum of cloudiness during these seasons. Sunshine averages more than 70% of possible during the three summer months, and precipitation occurs mostly during short duration showers or thunderstorms.

Illinois extends nearly 400 miles from north to south and winter temperatures show a contrast of approximately 14°F in mean temperature. Temperatures reach zero or below on an average of seven days annually in the extreme north and only one or less in the far south. The lowest temperature of record is -35°F at Mt. Carroll on January 22, 1930.

The north-south mean temperature range in July is only about 6°F as both sunshine and temperature are more uniform. Temperatures reach 90°F or higher on an average of near 20 days annually in the north and about 50 days in the south and west-central. The highest temperature of record is 117°F at East St. Louis on July 14, 1954.

Latitude is the major factor in both temperature and precipitation with the northern counties averaging cooler and drier than the south. Distance from the Gulf of Mexico and lower air mass temperatures both tend to reduce precipitation in the north. Annual precipitation is approximately 1½ times as great in the extreme south as in the extreme north, but most of the excess in the south falls during winter and early spring. Average total precipitation for December through March in the extreme southeast is about twice that in the extreme northwest. Precipitation during the warm season is more uniform and the annual average for April through September ranges from 21 to 24 inches throughout the State.

Precipitation during fall, winter, and spring tends to fall uniformly over large areas. In contrast, summer precipitation occurs principally as brief showers or thunderstorms, affecting relatively small areas. This erratic occurrence of summer showers generally results in an uneven distribution.

The annual average snowfall ranges from near 30 inches in the extreme north to only 10 inches in the extreme south. The most likely form of winter precipitation in the north is snow. More than 90% of Cairo's winter precipitation falls as rain. Snowfalls of 1 inch or more occur on an average of 10 to 12 days per year in the extreme north and decrease to 3 or 4 in the far south. Snow cover of an inch or more averages about 50 days annually in the north and only about 15 in the south.

Thunderstorms average about 35 to 50 annually, but most are quite harmless. On occasion they provide the source for hail, damaging winds, and tornadoes. Hail falls on an average of two or three days annually in the same locality, but only about once every two years during periods when crops are most susceptible to damage. Not all hailstorms have stones of sufficient size or quantity to cause major crop damage.

The mean freeze-free period ranges from less than 155 days in the extreme north to more than 210 days in the extreme south. The mean date of the last spring freeze ranges from April 5 in the extreme south, to May 5 in the extreme north. The mean date of the first fall freeze ranges from October 5 in the extreme northwest to October 25 in the extreme south. Most crop damaging freezes are radiational, that is, they occur under conditions of clear skies and light winds rather than through cold air invasion of the area.

#First fall freeze averages approximately 10 days later in Cook Co. near Lake Michigan.

Dates given are average for the district. Locations within the district having similar exposure usually agree within plus or minus five days. Crop damaging freezes are most often associated with radiation freezes. Under such conditions, clear skies and light winds, the temperature may vary 10°F or more at adjacent ridge and valley locations. Tables are based on temperatures in a standard Weather Service thermometer shelter at an approximate height of five feet above ground. Under best radiational conditions the temperature will be lower at ground level.

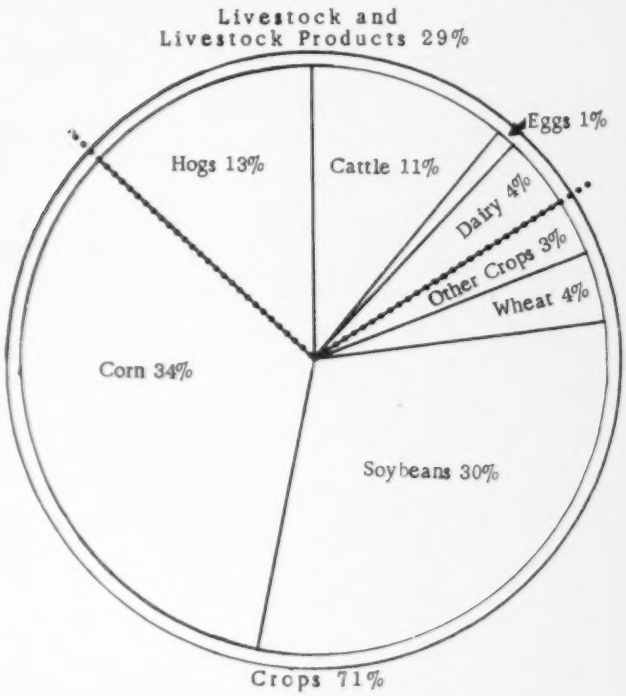
FARM INCOME

ILLINOIS CASH FARM INCOME BY COMMODITIES 1980



TOTAL CASH RECEIPTS INCREASE 13 PERCENT

Corn and soybeans provided the two largest sources of cash receipts to farmers in 1980. Corn sales accounted for 34% of the total cash receipts, up from 30% of the total in 1979. Soybeans accounted for 30% of the total cash receipts in 1980, unchanged from 1979.

Cash receipts by Illinois farmers for all commodities totaled 7.89 billion dollars, up 13% from 1979. Receipts from crops were up 21% from 1979, with corn, soybeans, and wheat each up considerably from 1979. Livestock receipts decreased 3% from last year, totaling 2.31 billion dollars. Decreases were noted in all major livestock categories except dairy products, which showed a 15% increase from 1979. Cash receipts for crops accounted for 71% of the total cash receipts in 1980, compared with 66% in 1979 and 68% in 1978.

TOTAL NET FARM INCOME DOWN 89% IN 1980

Total net farm income of Illinois farmers in 1980 decreased 89% from last year and 85% from the 1978 level. The total net income per farm was $1,950 compared to $17,906 in 1979 and $11,011 in 1978.

However, the 1980 realized net farm income (amount left after deducting farm production expenses from realized gross farm income) was up 30% from 1979, but 16% below the level in 1978. Even though gross farm income was up from 1979, an increase in farm production expenses as well as a decrease in farm inventories caused a sharp decline in net farm income.

FIELD AND SEED CROPS

1980 CROP PRODUCTION INDEX DOWN SHARPLY

Illinois' 1980 all-crop production index was 92% of its new 1977 base. This was 23 percentage points (20%) below 1979,6 percentage points below 1978, and the lowest level since 1974. Lower production levels for all major crops and most minor crops contributed to the lower level. Illinois farmers harvested 24,002,000 acres of crops in 1980, compared with 23,827,000 acres in 1979 and 23,151,000 acres in 1978.Despite the increased acreage, lower yields resulted in the lower production figures.

The table below shows the "All Crop Production Index" with respect to two base periods, 1957-59=100, and 1977=100. In future years only the new index (1977=100) will be published.

ALL CROP PRODUCTION INDEX, 1960-80

Year	1957-59=100	1977=100	Year	1957-59=100	1977=100	Year	1957-59=100	1977=100

CROP DEVELOPMENT and WEATHER 1980

1980 CROP DEVELOPMENT

Weather during 1980 was generally cool and dry. Small grains were very good over most of the State while row crops were better than average in the northern third but much below normal in the southern two-thirds. Fieldwork was virtually complete by the first of May. A hot, dry period occurred from the first of July through August in the southern two-thirds while the northern third was cool and wet through much of the summer.

The 1980 winter wheat crop was planted at a normal pace and came through the 1980 winter in good condition. Growing conditions were very good through early summer but harvest began a little later than normal. Harvest was complete on schedule as the State had a record crop for 1980.

Corn planting began during mid-April which is about average for the State and was virtually complete by late May. Excellent spring weather allowed the crop to be planted ahead of schedule. Extremely hot and dry conditions in the southern two-thirds of the State during pollination caused problems in development. Cooler temperatures and adequate rainfall in the North allowed for a good corn crop. Harvest losses were minimal due to excellent weather conditions during September and October. Many major corn producing areas experienced their poorest yields in recent years.

Soybean planting began slightly ahead of average as corn planting progressed very fast. Planting was complete by the first week in June, also ahead of normal. Soybeans also suffered from the hot, dry temperatures of July and August but not as bad as the corn crop. Harvest began early in September and was virtually complete by the end of October.

Oats seeding began the first part of April, which is behind normal, but was generally planted by the first week of May, which is slightly ahead of normal. Crop development was about equal to 1979 but behind normal. Harvest progressed very fast as hot, dry weather during July ripened the crop quickly. Harvest was complete about mid-August or on schedule. Oat acreage continued to decline but crop yields in 1980 were good.

The hay crop varied last year as most of the first cutting was average across the State but lack of rainfall reduced yields in the southern two-thirds for second and third cuttings of alfalfa. Northern areas experienced good crops throughout the year. Overall production of all hay was down from last year's record levels.

Rye production decreased 6% below 1979 levels as harvested acres decreased and yields were the same. Barley production decreased 22% below 1979 as both yields and harvested acreage decreased. Sorghum for grain production decreased 23% as harvested acres and yield both decreased.

Seeding of the 1981 winter wheat crop began around mid-September and was virtually complete by the first of November, slightly ahead of normal. The seedings were made under mostly good conditions although soil moisture was short in the central part of the State. Crop condition was mostly good as the crop went into winter dormancy. Plowing for 1981 corn and soybean acreage progressed ahead of normal and was about 80% complete by the end of 1980.

1980 WEATHER

Illinois was dry and rather cool during 1980. The Statewide precipitation averaged 5.76 inches below normal with an accumulation average of 32.27 inches for the year. State wide temperatures averaged .8 degrees below normal providing an annual average of 52.2 degrees. Nine months were below normal in precipitation, while six months were below normal in temperature. The Southwest District was the driest in the State averaging 12.74 inches below normal, while the Northeast District was 2.95 inches above normal. The two northern districts were the coolest averaging 1.4 degrees below normal.

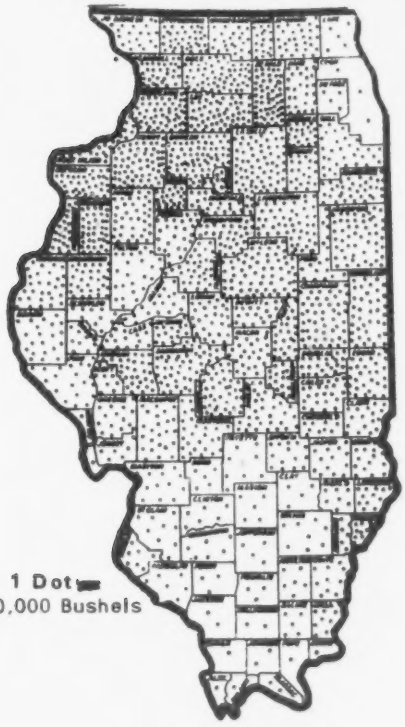
January and February were below normal in precipitation in every district with the South receiving the least amounts. The dry spell continued in the northern and southern portions of the State during March, but the central sections recorded above normal precipitation. Many districts continued to receive below normal precipitation through July. During May and June, however, localized thunderstorms gave up to five inches causing some flooding problems. The Illinois River was above flood stage at several locations during June. In July the Northeast District was above normal in precipitation for the first time in six months. Rainfall during August was above normal over most of the State except the extreme South. The Northwest was more than 4 inches above normal during August. Above normal precipitation continued through September over most of the State. Then a dry period began in October and lasted thru the end of the year with most districts recording below normal precipitation. The northern and western sections were the only areas receiving above normal precipitation in December, while the South was more than two inches below normal.

A warm period which started in late November of 1979 continued over much of the State through the first part of January with only minor cool periods in the North. A sharp cool period developed during the fourth week as temperatures averaged at the lowest level since February 1979. The cool spell lasted through April with below zero readings common through February. Freezing minimum temperatures were reported in scattered sections of the State thru the first week of May. In April, a brief, warm period sent readings into the 90's across the State setting several new maximum temperature records. Maximum readings of 80 to 95 degrees returned in late May and continued into June setting a few new maximum temperature records. Temperatures were above normal in most sections of the State during July and continued through September. Maximum readings climbed over the 100-degree mark in many areas in July and August and set several new maximum temperature records. In September, 90-degree readings were still common, mainly in the South. A cool period developed during the last week of September, breaking a nine week above normal period. The Northeast was the only area of the State with below-normal temperatures during August and September. In October temperatures averaged below normal in most districts ending a three month above normal period. Freezing temperatures in most areas during the first week of October ending the 1980 growing season and several new minimum temperature records were set. In the first week of November, maximum readings climbed into the 60's and 70's and then a near normal trend developed. The year ended with a near normal December, but 60 and 70 degree readings set several new maximum temperature records. Minimum readings dropped below zero in the North during the latter part of December.

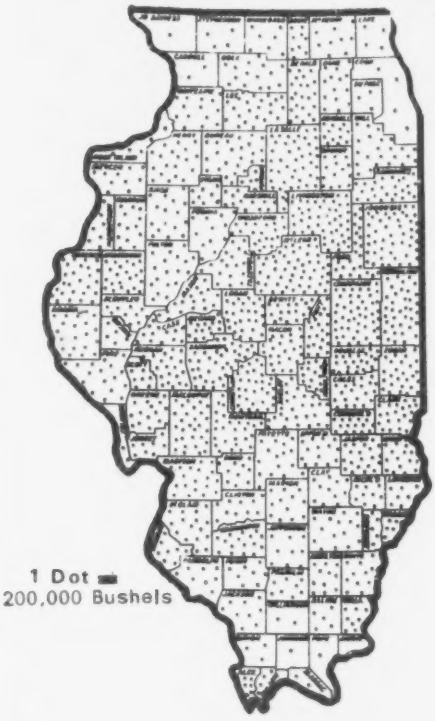
The first measurable snowfall in late October left up to 1.5 inches in most areas. In late November, 3 to 10 inches of snow fell with the heaviest amounts in the central and eastern sections. On the first of December, 2 to 4 inches fell in the Northwest. In late December, the North received 2 to 7 inches from two separate storms. A total of 14 tornadoes touched down during 1980 compared to 12 in 1979 and a 30 year average of 25 (1950-79). Seven persons were injured from 1 tornado in June with no injuries from the other 13 tornadoes.

DISTRIBUTION OF MAJOR CROPS

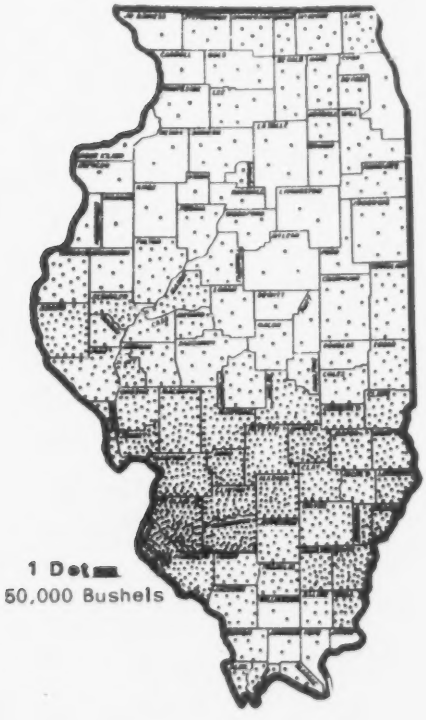
CORN PRODUCTION – 1980



SOYBEAN PRODUCTION – 1980



WHEAT PRODUCTION – 1980



OAT PRODUCTION – 1980

CROP DEVELOPMENT and VARIETY INFORMATION

Crop development information is collected and published each week during the crop preparation and growing season in the Weekly Weather - Crop Bulletin. In this section, planting and harvesting information for major crops is summarized along with selected information on crop maturity.

Also included in this section are data on leading varieties of soybeans and wheat; and planting and harvesting methods for corn.

FRUIT

1980 APPLE PRODUCTION

Illinois commercial apple production totaled 101 million pounds (2,405,000 bushels, 42-pound equivalents) in 1980. Production was down 8% from last year's 110 million lb. crop but 13% above 1978's production. Golden Delicious remained the leading variety, accounting for 33% of the crop, followed by Jonathan at 30% and Red Delicious at 24%. Total value of the 1980 crop is estimated at $12,019,000, down from last year's $13,640,000. Total crop value was down due to both a lower production and a lower price per pound. This year's per pound price is 11.9 cents compared to 12.4 cents last year and 12.8 cents in 1978.

Illinois apple orchards came through the winter in good condition. Growers reported the crop in good condition early in the season. Some crop variability developed due to hail and windstorms around the first of July in the southern part of the State. Dry weather reduced the size of the apples and made it necessary for some growers to thin the apples on the trees. Quality of the crop was reported as good.

1980 PEACH PRODUCTION

Peach production in Illinois for 1980 was estimated at 24.0 million pounds (500,000 bushels, 48-pound equivalents), 60% above last year's crop and 50% above the 16.0 million pounds produced in 1978. Value of the 1980 crop totaled $4,440,000, up 60% from the 1979 value of $2,775,000. The increase in value is attributable to the higher production in 1980 since the price per pound was 18.5 cents, unchanged from last year.

Mild winter weather allowed the peach orchards to come through in much better condition than the three previous years. Growers reported the crop in good to excellent condition during the growing season. Some localized damage resulted from the early summer wind and hailstorms. The dry weather conditions reduced the size of the peaches somewhat but the quality was reported as good.

VEGETABLES

1980 PROCESSING SUMMARY

Total 1980 production of the principal processing vegetables (cabbage for kraut, cucumbers for pickles, lima beans, green peas, sweet corn, snap beans, tomatoes, and beets) is estimated at 248,640 tons, down 33% from last year's 373,280 tons. The area harvested is estimated at 74,380 acres, down 20,640 acres (22%) from last year. Lower yields along with the reduced acreage accounted for the decrease in production in 1980 when compared to 1979. Value of the processing crops in 1980 is estimated at $26.7 million, down $7.1 million (21%) from $33.8 million in 1979. Estimates for carrots for processing, cucumbers for pickles, lima beans, green peas, tomatoes, and beets for processing are not published separately in order to avoid disclosing individual operations.

1980 FRESH MARKET SUMMARY

Total production of the principal fresh market vegetables (fresh and processed asparagus, fresh and processed carrots, fresh market cabbage, and sweet corn) in 1980 is estimated at 600,000 cwt., down 18% from last year's production of 734,000 cwt. Harvested area of 8,250 acres was also down from 1979 when it was 8,800 acres. Lower acreage levels in 1980 contributed primarily to the decline in production compared to 1979. Value of the crops was estimated at $7.3 million, an increase of 10% over last year's $6.7 million. Higher prices offset the decline in production resulting in the increase in value.

FLOWERS AND FOLIAGE PLANTS

TOTAL VALUE OF FLOWERS AND FOLIAGE PLANTS DOWN

Gross wholesale value of sales of selected flower types (cut and potted) and foliage plants in 1980 by Illinois commercial producers was $22.3 million, 6% less than the $23.7 million value of gross wholesale sales in 1979. The gross wholesale value for cut flowers was down 21% from 1979 as all surveyed types showed decreases except for standard chrysanthemums and snapdragons. Wholesale value for potted plants (including flowering and vegetable bedding plants) was virtually unchanged from 1979 even though all types showed decreases except for poinsettias and geraniums. The wholesale price per unit for cut flowers in 1980 was higher than in 1979 for all types except gladioli and snapdragons. Wholesale prices for potted plants were up from 1979 except for geraniums and poinsettias. Volumes sold for most cut flower types were lower in 1980 than in 1979. Gladioli showed an 18% increase and snapdragons increased by 20% over 1979. Volumes sold for most potted plants were also lower in 1980 than in 1979. Potted poinsettias and geraniums both had higher volumes in 1980 than in 1979. Both flowering and vegetable bedding plants were down in volume of sales when compared with 1979.

Net value of sales in 1980 of foliage plants for indoor or patio use was $3.0 million, down 5% from 1979 when it was $3.1 million. The 1980 area in production was up however, totaling 725,000 square feet compared with 612,000 square feet in 1979, an increase of 18%.

The Illinois Cooperative Crop Reporting Service began making official estimates in 1976 for the production of snapdragons, potted poinsettias, potted geraniums, potted lilies, potted hydrangeas, and flowering or vegetable bedding plants. Thus no production figures are available for these items prior to this time.

LIVESTOCK AND POULTRY

The total value of all Illinois cattle, hogs, sheep and chickens (excluding broilers) at the beginning of 1981 was 1.735 billion dollars, an increase of over 1 percent from a year earlier.

The number of cattle and calves in Illinois on January 1, 1981 was 2,650,000 head, 2 percent less than a year earlier. A $15 decrease in value per head, to $460, lowered the inventory value of the State's herd 5 percent, to $1,219,000,000.

There were 6,600,000 hogs and pigs on hand December 1, 1980, down 350,000 head or 5 percent, from the previous year. However, the drop in inventory was more than offset by a $16.50 increase in value per head, to $74.50. Total value of the swine herd increased 22 percent to $491,700,000.

The inventory of sheep and lambs on January 1, 1981 rose 6 percent to 184,000 head, the highest level since 1976. Value per head was $72.00, down $4.00 from a year earlier. Total inventory value, at $13,248,000, was nearly 1 percent above the previous year.

Chickens (excluding broilers) on farms December 1, 1980 were estimated at 6,850,000, a 1 percent drop from the year-earlier count. The inventory reduction coupled with a 10-cent decrease in value per head, to $1.55, resulted in total inventory value dropping to $10,618,000, 7 percent below a year earlier.

For the livestock and poultry included in these estimates cattle accounted for 70 percent of the total value at the beginning of 1981, compared with 75 percent a year earlier.

VALUE OF LIVESTOCK INVENTORY - FIRST OF THE YEAR, 1960-1981 (INCLUDES ALL CATTLE AND ALL SHEEP--JAN. 1 AND ALL HOGS, CHICKENS AND TURKEY BREEDERS--DEC. 1 PRECEDING YEAR)

PRICES

1980 Crop and Livestock Indexes

The Illinois Prices Received Index has been computed from 1956 to the present using new quantity weights each year. The Illinois Index relies on weights based on the average value and quantity of each commodity sold during a previous 5-year period.

The all farm products index of prices received by Illinois farmers in 1980 was 121% of the base period, 1974 through 1978, 6 points above the 1979 index. Prices received by farmers were fairly stable early in the year and dropped in April and May. An upward trend began in June and continued throughout the year.

Crop prices were up considerably from 1979 as prices continued to climb right through harvest. The crop index at 118 was up 11 points from the previous year. The prices received index for livestock at 125 was 5 points less than 1979. Livestock prices fluctuated throughout the year hitting a season low during April and May and season high in October.

1/ Annual average is for December previous year through November current year.

PRICES PAID

Prices paid by farmers for major production items are collected from dealers and merchants at regularly recurring intervals by means of mailed inquiries and personal interviews. This information provides a historical series of prices paid for important production goods and services but perhaps more importantly provides cost data used in calculating the index of prices paid by farmers at the U.S. level. Also included in the index of prices paid are interest, taxes and wage rates. The index of prices received for all farm products sold, when divided by the index of prices paid gives a measure of what farm products will buy in terms of production needs such as fertilizer and machinery, and family living needs.

The table below shows average prices paid by Illinois farmers for selected feeds and motor supplies in 1978 thru 1980. Beginning in January 1977, the Bureau of Labor Statistics Consumer Price Index (CPI) was used to measure farmers' costs for family living items. Therefore, data on family living costs are no longer collected by the Department of Agriculture.

State or regional prices paid for feed, seed, fuels, and fertilizer, and U.S. prices for all commodities are published currently in AGRICULTURAL PRICES, a monthly report of the Statistical Reporting Service of the U.S. Department of Agriculture, Washington, D.C. Regional prices for building materials, farm machinery, farm supplies, and pesticides, and State prices for motor supplies are first published in the Annual Summary in June of the following year. These publications are available upon request to the United States Department of Agriculture, Statistical Reporting Service, Washington, D.C. 20250.

PRICES PAID: Average prices paid by Illinois farmers, December 15, 1978-80 1/

Item and unit	1978	1979	1980
		Dollars	
		FEED	
Soybean meal, 44% protein, 100 lbs.	12.50	13.00	17.00
Laying feed "complete feed" per ton	180.00	205.00	245.00
Chick starter feed, per ton	205.00	220.00	265.00
Dairy feed, 16% protein, per ton	155.00	175.00	215.00
Hog concentrate, 38-42% protein, 100 lbs.	14.10	14.50	17.60
Beef cattle concentrate, 32-36% protein, 100 lbs.	10.30	11.50	13.50
		MOTOR SUPPLIES 2/	
Gasoline, filling station, unleaded, per gal.	.70	1.07	1.30
Diesel fuel, per gal.	.50	.90	1.03
Motor oil, all-weather, (high detergent) per gal.	3.80	4.40	5.50
Grease, 35-lb. pail	19.00	24.50	32.00
Tires, auto, each			
Bias-belted, G78-15	44.50	51.00	52.00
Radial, steel belted, 205-15 GR78-15	73.00	78.00	80.00
Tires, truck, 7.50 x 20, 10-ply, each	99.00	3/150.00	3/175.00
Tires, tractor, rear, 13.6 x 28, 4-ply, each	145.00	4/285.00	4/305.00
Storage batteries, CPR 220-310 AMPS	43.00	55.00	57.00
Anti-freeze, permanent, per gal.	4.10	4.85	5.30

1/ Averages at independent and chain stores. 2/ October 15. 3/ 9.00-20, 10-ply. 4/ 15.5-38, 6-ply.

OTHER DATA SERIES

This section contains data series which did not fall under other major category headings. Included in this bulletin are fertilizer information, and farm employment and wage rates.

1/ This fertilizer information was obtained when interviewing farm operators for Objective Yield Surveys conducted by the Statistical Reporting Service and are not official estimates of total fertilizer use. The samples are relatively small and the data are subject to sampling fluctuation. 2/ Percentages apply to acres receiving fertilizer, not to total acres harvested.

COMMODITIES INCLUDED IN THE ILLINOIS FARM REPORT - A BI-WEEKLY REPORT ISSUED ABOUT THE 12TH AND 25TH OF EACH MONTH BY THE ILLINOIS CROP REPORTING SERVICE

Commodity	Approximate date of report	Source of data for estimates
Field Crops:		
Winter wheat seedings	December	Farm operators
Prospective spring plantings	February	Farm operators
Harvested acreage forecasts	July	Farm operators
Yield & production forecasts	Monthly during growing season	Farm operators / Field measurements 1/
Annual crop summary	January	Farm operators
Stocks of grain (farm and off-farm)	January, April, June, September 2/ October	Farm operators and mills & elevators
Weather - Crop	3 P.M. Monday - April thru November	Local observers
Commercial fertilizer sales	Monthly	Bureau of Products Inspection and Standards' totals of weekly reports filed in accordance with the Illinois Fertilizer Act
Seeds	January, August, October	Farm operators and shippers
Popcorn	January, July	Processors
Fruit:		
Peach production	June, July, August, January	Fruit growers
Apple production	July, August, October, January	Fruit growers
Vegetables:		
Fresh market, acreage and production	April, July, October	Vegetable growers
Processing, acreage and production	March, June, August, September, December	Vegetable processors
Meat Animals:		
Cattle inventory and calf crop	February, August	Farm operators
Sheep inventory	February	Farm operators
Hog inventory and pig report	March, June, September, December	Farm operators
Cattle on feed	January, April, July, October	Farm operators
Sheep and lambs on feed	January	Farm operators
Lamb and wool crop	March, July	Farm operators
Commercial slaughter	Monthly	Livestock slaughter plants
Poultry:		
Chicken inventory	February	Farm operators / Hatcheries
Turkey inventory	January	Farm operators / Hatcheries
Egg production	Monthly	Farm operators / Commercial egg producers
Chicks hatched	Monthly	Hatcheries
Milk:		
Milk production	Monthly	Milk producers
Dairy products manufactured	June	Milk product manufacturers
Honey:		
Number colonies and production honey and beeswax	January	Honey producers
Prices:		
Local market prices of farm products	Monthly	Farm product buyers
Prices paid by farmers for feed	Monthly	Merchants
Timber prices	April, October	Timber buyers
Farm Employment:		
Employment on farms and farm wage rates	August	Farm operators

1/ Counts and measurements from small plots at monthly intervals prior to maturity. Mature grain and soybeans harvested and subjected to detailed laboratory analysis. 2/ Soybeans only.
